Legit Creations — Full Company & Website Audit

Assessment date: 11 October 2026 · Scope: corporate positioning, brand, SEO, technical quality, credibility, and growth readiness

Executive assessment

Legit Creations (LGC)

Official website: www.legitcreations.com.ng ↗
Positioning descriptor surfaced in search: “Performance is the Product.” Performance is t

Overall verdict: promising positioning, insufficient independent evidence for a complete technical or commercial verdict.

The domain resolves to the `www` version, and a browser retrieval attempt reached the destination but returned no readable page content.

Internal Error +1

That is a limitation of this assessment, not proof that the site is broken for

normal visitors.

I can assess the available public evidence and your established business direction. I cannot responsibly assign verified Lighthouse scores, confirm the website's live functionality, or certify the company's legal status from the evidence retrieved so far.

Findings at a glance

Audit area	Current assessment	Evidence status
Corporate positioning	Potentially strong performance-led identity	Partial
Brand identity	Descriptor is identifiable; full visual system unverified	Partial
Product and service portfolio	SEOC gives LGC a defined commercial initiative	Established project context
SEO and indexing	Public search footprint needs investigation	Inconclusive
Technical performance	No verified live test results	Not tested
Client and partner credibility	Requires verifiable evidence of delivery and business details	Not established

Investor readiness	Corporate narrative and supporting evidence need review	Not established

These are evidence classifications, not a numerical score. Assigning a percentage without inspecting the live site and testing it would create false precision.

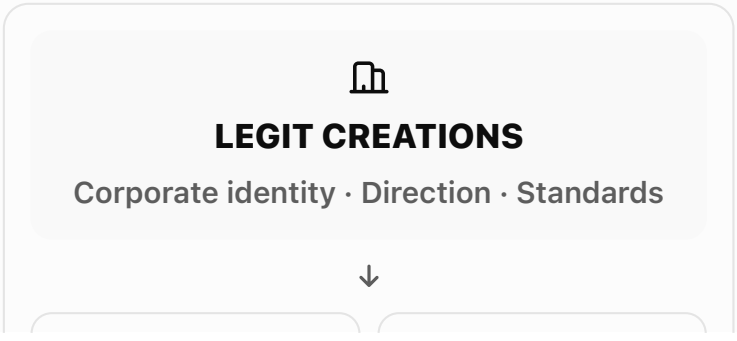

1. Corporate identity and business strategy

Strategic opportunity

My assessment is that LGC should be positioned as a company that **builds and develops digital products and delivers commercially useful digital solutions—** rather than being defined solely by website development.

This is a strategic recommendation based on your project direction, not a claim that the live website currently communicates all of it.

Recommended corporate architecture

Commercial delivery

Client solutions, implementation, technical execution and measurable outcomes.

Products and ventures

SEOC and future initiatives with their own purpose, identity and development roadmap.

Where SEOC fits

SEOC — *Sweat Equity over Cash* — should have a clear place in LGC's portfolio. Its initial commercial mandate focuses on performance-first B2B commerce infrastructure for brands already selling in the market.

That gives LGC a concrete story to tell: it is not only interested in digital technology; it is developing an approach to improving real commercial systems.

However, the website must distinguish between:

- **Available services:** what a client can purchase now.
- **Active products:** what is being built or validated.
- **Future initiatives:** what remains planned rather than delivered.

That distinction is especially important when presenting the company to universities, business partners, prospective clients and investors. It strengthens credibility without overstating traction.

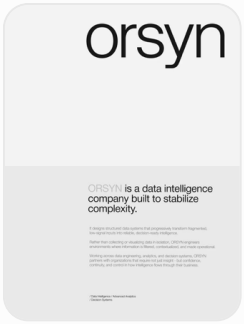

2. Branding and positioning

The phrase *"Performance is the Product"* is the clearest brand-related signal I could retrieve from the site's indexed title.

Performance is t

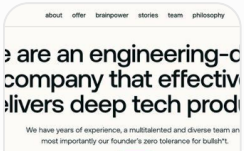

It is a useful positioning direction for a technically focused company, but its effectiveness depends on how the rest of the brand supports it.

What I would evaluate

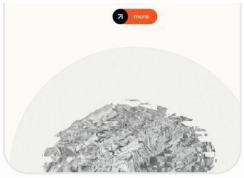

Brand consistency

Does the logo, typography, colour palette, spacing and imagery feel like one coherent company? Can the same identity work on the website, proposals, product pages and professional profiles?

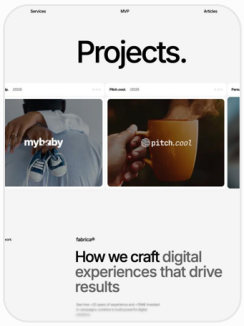

Positioning clarity

Can a first-time visitor

explain what LGC does after reading the first screen? A compelling slogan should support a clear description of the business, not replace it.

Evidence-led design

Are claims supported by actual products, demonstrations, case studies and results? Visual sophistication is useful, but evidence is what converts it into commercial trust.

These images illustrate design directions to evaluate; they are not screenshots of the LGC website.

Recommendation: Keep the performance-led direction if it accurately represents LGC's standards. Pair it with plain, specific corporate language. Avoid generic claims such as “industry-leading,” “revolutionary” or “trusted by global brands” unless they can be substantiated.

3. SEO and discoverability

Requires verification

My exact-domain searches did not return useful indexed pages for the LGC domain.

Performance is t That is a signal worth investigating, but search-engine indexing can vary by query, location, and timing. It does not establish that Google has indexed zero pages.

I also attempted to retrieve the site's `robots.txt`, `sitemap.xml`, and web manifest, but the research browser could not access those endpoints. Their actual contents and HTTP responses therefore remain unknown.

Internal Error +2

SEO audit checklist

Area	What should be verified
Indexing	Google Search Console indexed-page and exclusion reports
Crawlability	HTTP responses and robots directives
Sitemap	Valid XML sitemap containing intended canonical URLs
Metadata	Unique titles and descriptions for each important page
Canonical URLs	Consistent `www` or non-`www` preference
Structured data	Accurate Organization, WebSite and relevant service markup
Content	Distinct pages for the company,

	services, products and case studies
Social sharing	Page-specific Open Graph title, description and image
International reach	Appropriate country and audience targeting; no unnecessary localization markup
Search performance	Search Console impressions, clicks, queries and page-level trends

Priority fixes

1. Verify the preferred domain and redirect behaviour using HTTP response tests.
2. Check Google Search Console for ownership verification, indexing errors and manual actions.
3. Inspect the actual sitemap and robots directives.
4. Confirm each important page has unique metadata and a canonical URL.
5. Publish useful, substantive pages that explain the company's capabilities and products.

For direct verification, use Google Search Console ↗ and Google's Rich Results Test ↗. These tools can provide evidence that a public search result alone cannot.

4. Technical quality and website

4. Technical quality and website performance

No verified benchmark

I could not run an actual Lighthouse audit against the live page through the available research browser. I will not invent Performance, Accessibility, Best Practices or SEO scores.

For LGC, technical quality should be a demonstrable part of the product—not merely a claim in the brand messaging.

Recommended acceptance criteria

These are proposed engineering targets, not measured results.

Lighthouse Performance Mobile and desktop audits	**95–100**
Accessibility Automated checks plus manual keyboard testing	**100**
Core Web Vitals Good thresholds at the 75th percentile	LCP ≤ 2.5 s INP ≤ 200 ms CLS ≤ 0.1
Best Practices and SEO	

Security, metadata, crawlability and technical checks	**100**

The Core Web Vitals thresholds above are Google's established good-performance thresholds. Lighthouse scores are lab measurements; real-user Core Web Vitals are assessed separately. See Web Vitals documentation ↗ and Lighthouse documentation ↗ .

What I would test first

1. **Initial loading:** LCP element, render-blocking CSS, fonts, image dimensions and image delivery.
2. **JavaScript:** unused client-side code, third-party scripts, hydration overhead and unnecessary dependencies.
3. **Layout stability:** image sizing, font swaps, banners and content injected after initial render.
4. **Accessibility:** contrast, semantic headings, form labels, keyboard navigation and focus visibility.
5. **Security and reliability:** HTTPS, redirect chains, error responses, security headers, form handling and dependency vulnerabilities.

For a Next.js implementation, I would also

check that Server Components remain the default, client-side JavaScript is limited to genuine interactive requirements, and analytics are integrated without unnecessarily delaying the page.

Important: A score of 100 is not proof of a secure website, a good user experience or a commercially effective business. Performance is one part of the overall assessment.

5. Corporate credibility and trust

This is where I would concentrate before using the website as the primary introduction to LGC for institutional or investment opportunities.

A prospective partner should be able to establish five things quickly:

- Who operates the company.
- What the company actually does.
- What it has built or delivered.
- How to contact the appropriate person.
- Which claims can be independently verified.

Evidence worth adding or verifying

Evidence	Why it matters
Accurate legal business name and registration	Allows counterparties to

name and registration details, where applicable	counterparties to verify the legal entity
Professional company contact details	Establishes a reliable communication channel
Product and project portfolio	Demonstrates execution
Case studies with clearly stated outcomes	Connects technical work to business value
Privacy policy and appropriate legal disclosures	Establishes responsible data handling
Company and product profiles on relevant	Improves discoverability and

For Nigerian registration verification, the official Corporate Affairs Commission provides a corporate registry website ↗ . I have not verified LGC's registration status, so I make no claim about whether it is incorporated or registered under a particular legal structure.

If LGC is still developing its portfolio, do not manufacture client testimonials, partnerships, revenue figures or case studies. Label prototypes, internal projects and work in progress accurately. Honest

early-stage evidence is more valuable than artificial maturity.

6. Readiness for different audiences

Potential clients

They need a clear service offering, examples of work, expected outcomes, a straightforward contact path and enough information to decide whether LGC is a suitable supplier.

Business partners

They need to understand LGC's capabilities, operating model, complementary strengths, project ownership and the practical basis for collaboration.

Universities and institutions

They need a credible company profile, an accurate account of the founder's responsibilities, documented projects and clear contact details. Claims about scale or maturity should match the evidence.

Investors

They need more than a polished

website: a defined business model, evidence of customer demand, product differentiation, commercial traction where available, and a credible financial and execution plan.

My conclusion is that one corporate website can serve all four audiences, provided the information architecture is deliberate. It should not try to turn every visitor into the same type of lead.

7. Prioritized action plan

Phase 1 — Verify First

Inspect the live site in a real browser; test HTTP status codes, redirects, mobile rendering, navigation, contact forms and critical errors. Capture Lighthouse results.

Phase 2 — Establish discoverability

Verify Search Console, indexing, sitemap, canonical URLs, metadata, structured data and page-level SEO.

Phase 3 — Strengthen the corporate narrative

Clarify LGC's positioning, organize the service and product portfolio, distinguish SEOC's current scope from

its future vision, and add genuine proof of execution.

Phase 4 — Measure and improve

Monitor real-user performance, search impressions, qualified enquiries, conversion rates and the results of individual projects.

Final verdict

LGC's opportunity is to make its corporate identity, products and technical execution reinforce one another. The performance-led positioning provides a potentially strong foundation, and SEOC offers a defined initiative around which the company can demonstrate its ability to turn ideas into practical commercial systems.

The biggest unresolved issue in this audit is evidence: I could not inspect the full live page or run direct performance tests, and the available search results do not establish the company's broader market traction. That prevents a defensible rating of the current website.

The next step

To turn this into a genuinely technical audit, send me **a Lighthouse report from the live website**. On a computer, open the website in Chrome, select Developer Tools →

Lighthouse, choose Mobile and Desktop as separate runs, and generate the reports. You can share the report files or screenshots here.

With that evidence, I can identify actual performance bottlenecks, accessibility failures, SEO problems and specific improvements, rather than giving you only a strategic checklist.

If you want, I can:

- Request a detailed Lighthouse audit guide for LGC
- Suggest a structured plan to collect and verify LGC's business evidence
- Outline strategies to clarify LGC's website content for diverse audiences
